

Warmup WSR Self-Regulating Cable

Snow & Ice Melting for Roof & Gutter Trace Applications

Self-Regulating Technology

Automatically adjusts heat output based on operating temperature, ensuring energy efficiency and preventing overheating.

Engineered for Outdoor Use

Designed specifically for exposed areas like roofs, gutters, and downspouts providing reliable drainage, protecting properties from leaks and roof damage.

Range of Approved Accessories

Simplifies installation, ensuring compliance and reducing installation time.

cCSAus Certified

Guarantees compliance with safety standards, making it suitable for a wide range of applications including hazardous areas.

Overview

Warmup's WSR Self-Regulating Cable is specifically engineered for outdoor exposed areas for roof and gutter de-icing, providing drainage solutions for several applications. The WSR self-regulating cable helps ensure proper drainage and protection in cold weather conditions.

Its advanced positive temperature coefficient [PTC] self-regulating core is positioned between two 16 AWG multi-strand tinned copper bus wires. These are then insulated with a modified polyolefin layer which is wrapped in a tinned copper braid for grounding. The cable's outer jacket, made from modified polyolefin, ensures superior resistance to UV, abrasion, chemical, and mechanical wear, enhancing durability in harsh conditions.

The PTC self-regulating core automatically adjusts heat output in response to temperature changes, delivering more heat when snow and ice is present and reducing output as they melt ensuring energy efficient protection of roof and gutter systems.

The cable is cCSAus certified for use in Residential, Commercial & Industrial applications. Warmup provides a complete range of system accessories for the WSR cable to ensure fast and hassle-free installation. To maintain cCSAus compliance, only Warmup approved accessories may be used. Refer to the Part Numbers page for guidance.

Please be advised Warmup Inc., provides these technical specifications and or instructions on a self help basis. We take every precaution to ensure they are accurate. Some of the products are sourced from manufacturers and we relay that information on to you. We do not have the technical specifications reviewed by an engineer and sometimes errors do happen. Our products are only reviewed with an ordinary level of care and when using said products in a situation that warrants additional care please be sure to conduct your own review. As such we strongly suggest before installing our products you have them reviewed by a professional engineer or qualified professional. We under no circumstances warrant our products for a particular use unless specifically agreed in writing.

Guide to Hazardous Locations*

A Class I, Division 2 location is a location:

- (i) In which volatile flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems or in case of abnormal operation of equipment, or
- (ii) In which ignitable concentrations of flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors are normally prevented by positive mechanical ventilation and which might become hazardous through failure or abnormal operation of the ventilating equipment, or
- (iii) That is adjacent to a Class I, Division 1 location, and to which ignitable concentrations of flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors above their flash points might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Class I Group Classifications

A Acetylene

B Flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.45 mm or a minimum igniting current ratio (MIC ratio) less than or equal to 0.40

C Flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.45 mm and less than or equal to 0.75 mm, or a minimum igniting current (MIC) ratio greater than 0.40 and less than or equal to 0.80.

D Flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current (MIC) ratio greater than 0.80.

A Class II, Division 2 location is a location:

- (i) In which combustible dust due to abnormal operations may be present in the air in quantities sufficient to produce explosive or ignitable mixtures; or
- (ii) Where combustible dust accumulations are present but are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but could as a result of infrequent malfunctioning of handling or processing equipment become suspended in the air; or
- (iii) In which combustible dust accumulations on, in, or in the vicinity of the electrical equipment could be sufficient to interfere with the safe dissipation of heat from electrical equipment, or could be ignitable by abnormal operation or failure of electrical equipment.

Class II Combustible Dust Group Classifications

F Atmospheres containing combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see ASTM D3175-2017, Standard Test Method for Volatile Matter in the Analysis Sample of Coal and Coke, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. [499:3.3.9.1.2] Although coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts only those atmospheres containing combustible carbonaceous dust that have more than 8 percent total entrapped volatiles are Class II, Group F.

G Atmospheres containing combustible dusts not included in Group E or Group F, including flour, grain, wood, plastic, and chemicals.

Equipment Temperature Class

The temperature class or operating temperature at a 104°F (40°C) ambient temperature, or at the higher ambient temperature if the equipment is rated and marked for an ambient temperature of greater than 104°F (40°C).

T3 = ≤ 392°F (≤ 200°C); **T5** = 212°F (≤ 100°C); **T6** = ≤ 185°F (≤ 85°C)

A Zone 1 location is a location

- (i) In which ignitable concentrations of flammable gases or vapors are likely to exist under normal operating conditions; or
- (ii) In which ignitable concentrations of flammable gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or
- (iii) In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitable concentrations of flammable gases or vapors and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or
- (iv) That is adjacent to a Zone 0 location from which ignitable concentrations of vapors could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Guide to Hazardous Locations*

A Zone 21 location is a location where one of the following apply:

- (i) Ignitable concentrations of combustible dust, combustible fibers/flyings, or ignitable fibers/flyings are likely to exist occasionally under normal operating conditions.
- (ii) Ignitable concentrations of combustible dust, combustible fibers/flyings, or ignitable fibers/flyings might exist frequently because of repair or maintenance operations or because of leakage.
- (iii) Equipment is operated or processes are carried on of such a nature that equipment breakdown or faulty operations could result in the release of ignitable concentrations of combustible dust, combustible fibers/flyings, or ignitable fibers/flyings and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition.
- (iii) The location is adjacent to a Zone 20 location from which ignitable concentrations of combustible dust, combustible fibers/flyings, or ignitable fibers/flyings could be communicated.
Exception: When communication from an adjacent Zone 20 location is minimized by adequate positive pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.
- (iv) Group IIIC combustible dusts are present in hazardous quantities occasionally, under normal or abnormal operating conditions, or frequently because of repair or maintenance operations or because of leakage.

Symbols explained

AEx The symbol AEx identifies the equipment as meeting American national standards. The symbol Ex is used in European Union countries. Only equipment marked AEx has been evaluated for use in electrical systems and hazardous locations covered by the NEC

Equipment Suitable for Hazardous (Classified) Locations

Mark	NEC Area Classification	Type (Level) of Protection
eb	Zone 1	Increased safety (Group II)
tb	Zone 21	Protection by enclosure (Group III)

Equipment Protection Level

The EPL indicates the level of protection provided by the equipment and is correlated to the zone in which the equipment will be installed and operated.

Mark	NEC Area Classification	Type (Level) of Protection
Gb	Zone 1	equipment for explosive gas atmospheres, having a "high" Level of Protection, which is not a source of ignition in normal operation or during expected malfunctions
Db	Zone 21	equipment for explosive dust atmospheres, having a "high" Level of Protection, which is not a source of ignition in normal operation or during expected malfunctions

Material Groups

IIC Group IIC: Atmospheres containing acetylene, hydrogen, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.50 mm or minimum igniting current (MIC) ratio less than or equal to 0.45.

IIIC Group IIIC: Combustible metal dust, including combustible metal fibers/flyings.

Equipment marked Group IIIC shall be permitted for applications requiring Group IIIA or Group IIIB equipment.

IECEx/ATEX standards

Ex The symbol Ex is used in European Union countries.

60079-30-1 STANDARD FOR SAFETY
Explosive Atmospheres – Part 30-1: Electrical Resistance Trace Heating – General and Testing Requirements

* This guide is provided for reference purposes only. It summarizes typical classifications and installation types based on information from the National Electrical Code (NEC), Canadian Electrical Code (CEC), and relevant international standards.

This guide does not replace or supersede any official code or standard. For the most accurate and up-to-date requirements, always consult the NEC, CEC, and applicable local regulations, as well as the latest versions of IECEx/ATEX standards. Installation in hazardous locations must comply with all certification conditions and use only Warmup approved accessories as specified in the product documentation.
